Ebrahem Awad

Excel & Power BI

Sales experience applied to dashboard design, performance reporting and profitability analysis.

FOUR SELECTED PROJECTS

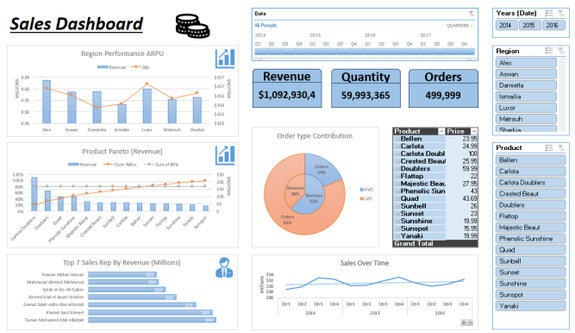

01 Liceria Furniture Shop

Excel sales & delivery performance

02 Arla

Power BI sales & target achievement

03 Sales Performance

Excel product Pareto & transaction analysis

04 Revenue & Margin

Power BI supplier profitability analysis

PROJECT 01

Liceria Furniture Shop

Sales & Delivery Performance: an interactive Excel dashboard for channels, categories, customers and delivery outcomes.

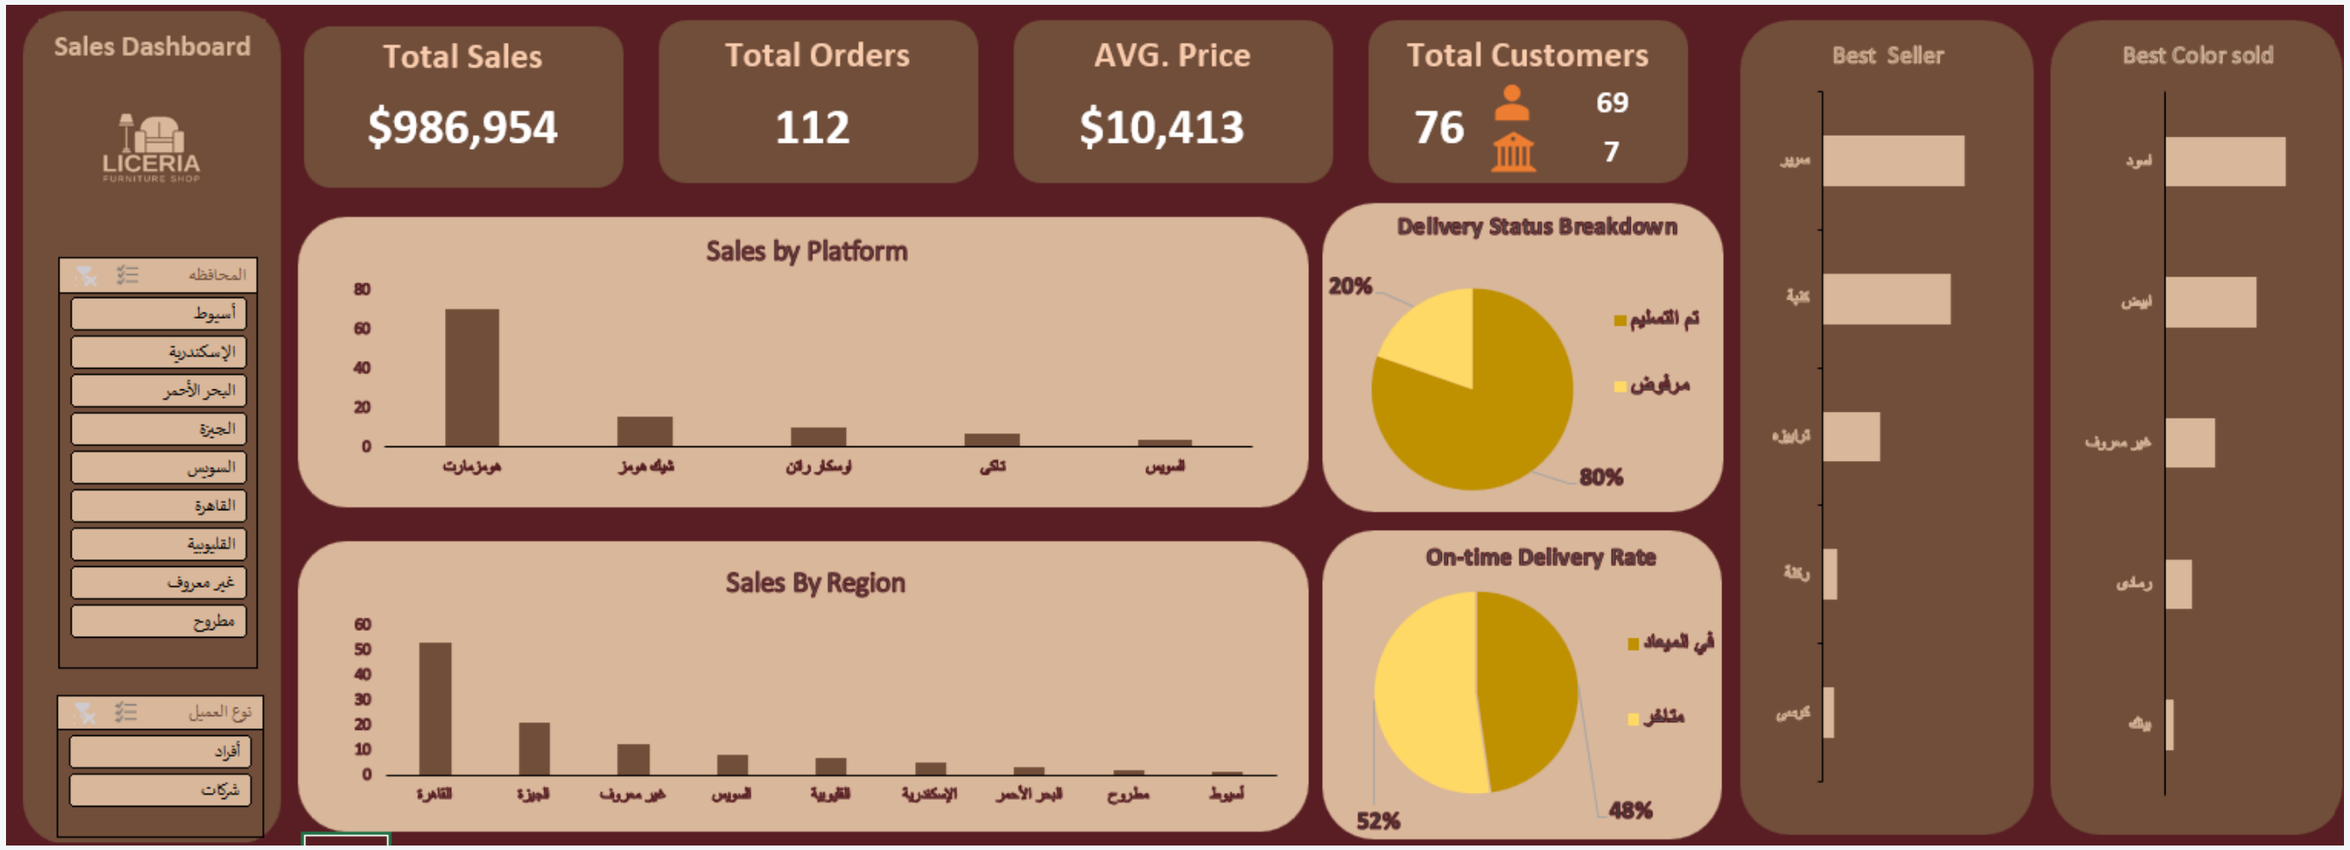

Exhibit 1. Supplied dashboard screenshot. The displayed Best Seller chart and delivery timing KPI need reconciliation before publication.

986,953.50

Recorded sales

Sum of prepared sales amounts; currency unconfirmed.

112

Product/order records

Prepared data contains no unique Order ID.

76

Distinct customer names

69 individual names and 7 company names in the pivot.

BUSINESS CASE

From order records to useful decisions

Find sales concentration and delivery gaps while keeping KPI definitions traceable.

The business question

Which channels and product categories contribute most sales, where are customers located, and how reliably are delivered records completed on time?

The dataset

126 original records and 112 prepared records. Known order dates span July-December 2024. The workbook stores prices, quantities, customer types, platforms, locations and delivery dates.

01 Sales concentration

Homzmart contributes 641,412.00, or 65.0% of recorded sales, and 70 of 112 records.

Action: monitor exposure to this channel and compare the economics of alternative channels before changing investment.

02 Product mix

After trimming category labels, beds contribute 629,666.50 (63.8%) and sofas 219,235.00 (22.2%).

Action: review availability and margins for these categories. These are revenue shares, not unit rankings.

03 Delivery reliability

42 of 86 delivered records with both dates were on time: 48.8%. Four delivered records lack a required date. Investigate late deliveries and improve date completeness.

Interpretation boundaries

112 is a record count, not a proven order count. The listed average price is not average order value. Rejected records are not automatically cancelled orders.

Source: Table23 in the supplied Liceria workbook. Findings are recomputed from saved prepared values; no native Excel refresh was executed.

TECHNICAL EVIDENCE

How the Excel dashboard was built

Each skill is tied to an observable feature in the supplied workbook.

Exhibit 2. Governorate and customer-type slicers.

Structured tables

Table2 holds original records. Table23 holds prepared data. Structured references calculate sales as quantity multiplied by selling price.

Formulas and delivery logic

IF / ISBLANK formulas calculate planned and actual lead times. A delivery-status formula compares actual and promised dates.

Pivots, charts and the Data Model

The workbook contains 10 PivotTables, six chart definitions, two slicer caches and a workbook Data Model connection.

Power Query

Embedded M code confirms Excel.CurrentWorkbook sources and explicit data-type conversion. Additional cleaning steps are not established by that code.

Validation work identified

Reconcile the saved bed-category value of 243,466 with the prepared total of 629,666.50. Standardize category spelling and whitespace, check filters and refresh. Correct missing-date classification: the dashboard shows 47.7% on time, while the assessable-record rate is 48.8%. Document why 14 records were excluded and validate slicer connections.

Evidence: workbook tables, formulas, pivot/chart definitions and embedded M code. Dashboard image: supplied screenshot. Original workbook retained unchanged.

PROJECT 02

Arla Sales Performance & Target Achievement

A Power BI report for actual versus target volume, returns, sales mix and sales-team performance.

Exhibit 1. Supplied dashboard snapshot. Reporting period and filter context are not visible; all figures below refer to this snapshot.

SAR 346.28M

Sales

Exact displayed value: SAR 346,280,640.65.

11.01M kg

Actual volume

Exact displayed value: 11,012,403.68 kg.

102.3%

Target achievement

Computed from actual 11.01M / target 10.76M kg.

BUSINESS CASE

Achievement, concentration & follow-up

Turn the dashboard snapshot into specific questions for the sales team.

The business question

Is total volume meeting the target? Which teams are below target? How concentrated are sales by depot and customer group, and what should be investigated about returns?

How the report supports analysis

KPI cards summarize sales and volumes. A monthly combo chart compares actual and returned KG. Category bars and composition charts describe the mix. The matrix expands from supervisor to route and sales rep.

01 Above target overall

Actual volume exceeds target by 247,505.68 kg, or 2.3%. One visible supervisor row is at 93% achievement.

Action: investigate lower-performing routes rather than treating the overall result as uniform team performance.

02 Concentrated sales mix

Riyadh accounts for 69.65% of sales by depot. Othaim accounts for 43.12% of sales by customer group.

Action: compare these shares with customer and depot targets. A large share alone does not establish efficiency or risk.

03 Returns in context

The matrix shows 289,612 kg returned volume. Relative to displayed actual volume, this is 2.63%. Investigate patterns by month and product; the snapshot does not identify causes.

Metric definitions

Achievement = actual KG / target KG. Return-to-actual volume = returned KG / actual KG. Confirm gross/net sales and whether actual KG already includes returns before interpreting these ratios.

Source: supplied Power BI dashboard image. Ratios are independently calculated from displayed figures; saved DAX expressions were not evaluated.

TECHNICAL EVIDENCE

Design decisions that show BI skills

Verified report configuration plus visible evidence from the supplied dashboard.

Sales Supervisors	Actual KG	Target KG	Achievment	Returns KG
Islam Hamed	3,240,968	2,994,247	108%	33,762
Hassan Eyoni	2,491,014	2,412,232	103%	88,920
Ahmad Sabbah	2,102,668	2,256,066	93%	36,379
Mohammad Naim Aljazaery	1,705,943	1,685,757	101%	82,064
Abdullah Aljebaly	1,471,810	1,416,595	104%	48,489
Total	**11,012,404**	**10,764,898**	**102%**	**289,612**

Exhibit 2. Hierarchical performance matrix.

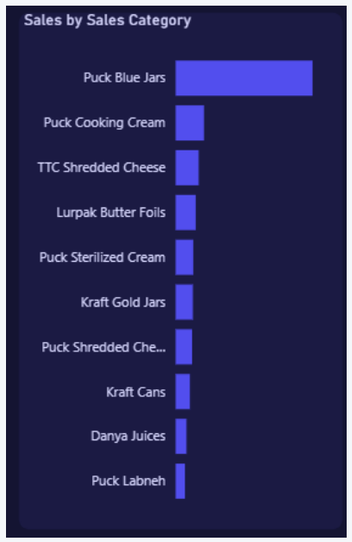

Exhibit 3. Category ranking by Sales. The PBIX configures a Top 10 filter.

The matrix exposes actual, target, achievement and returns together, so performance can be investigated beyond headline totals.

Measures and formatting

Dashboard visuals reference Sales, Actual KG, Target KG, Achievment and Returns KG. Displayed formats distinguish currency, kilograms and percentages.

Hierarchical analysis

The matrix contains supervisor, route and sales-representative levels, with expansion states and measure-based sorting.

Report-page tooltip

The monthly chart is linked to a hidden tooltip page with an achievement gauge and supporting actual, target and returns cards.

Model organization

The diagram lists FSales, dCustomers, dproduct, dSalesPerson, dCalender and Key Measure. Relationship keys, cardinality and DAX require native-model verification.

Final checks

Confirm period and filter context, month ordering and target grain. Check tooltip interaction and saved DAX. Rename or hide the development Page 1. Add a model screenshot to document the relationships.

Evidence: supplied PBIX report/page/visual definitions, DiagramLayout and screenshot. Native refresh and DAX evaluation were not performed.

PROJECT 03

Sales Performance Dashboard

A large-data Excel dashboard covering regional performance, product contribution and sales-representative rankings.

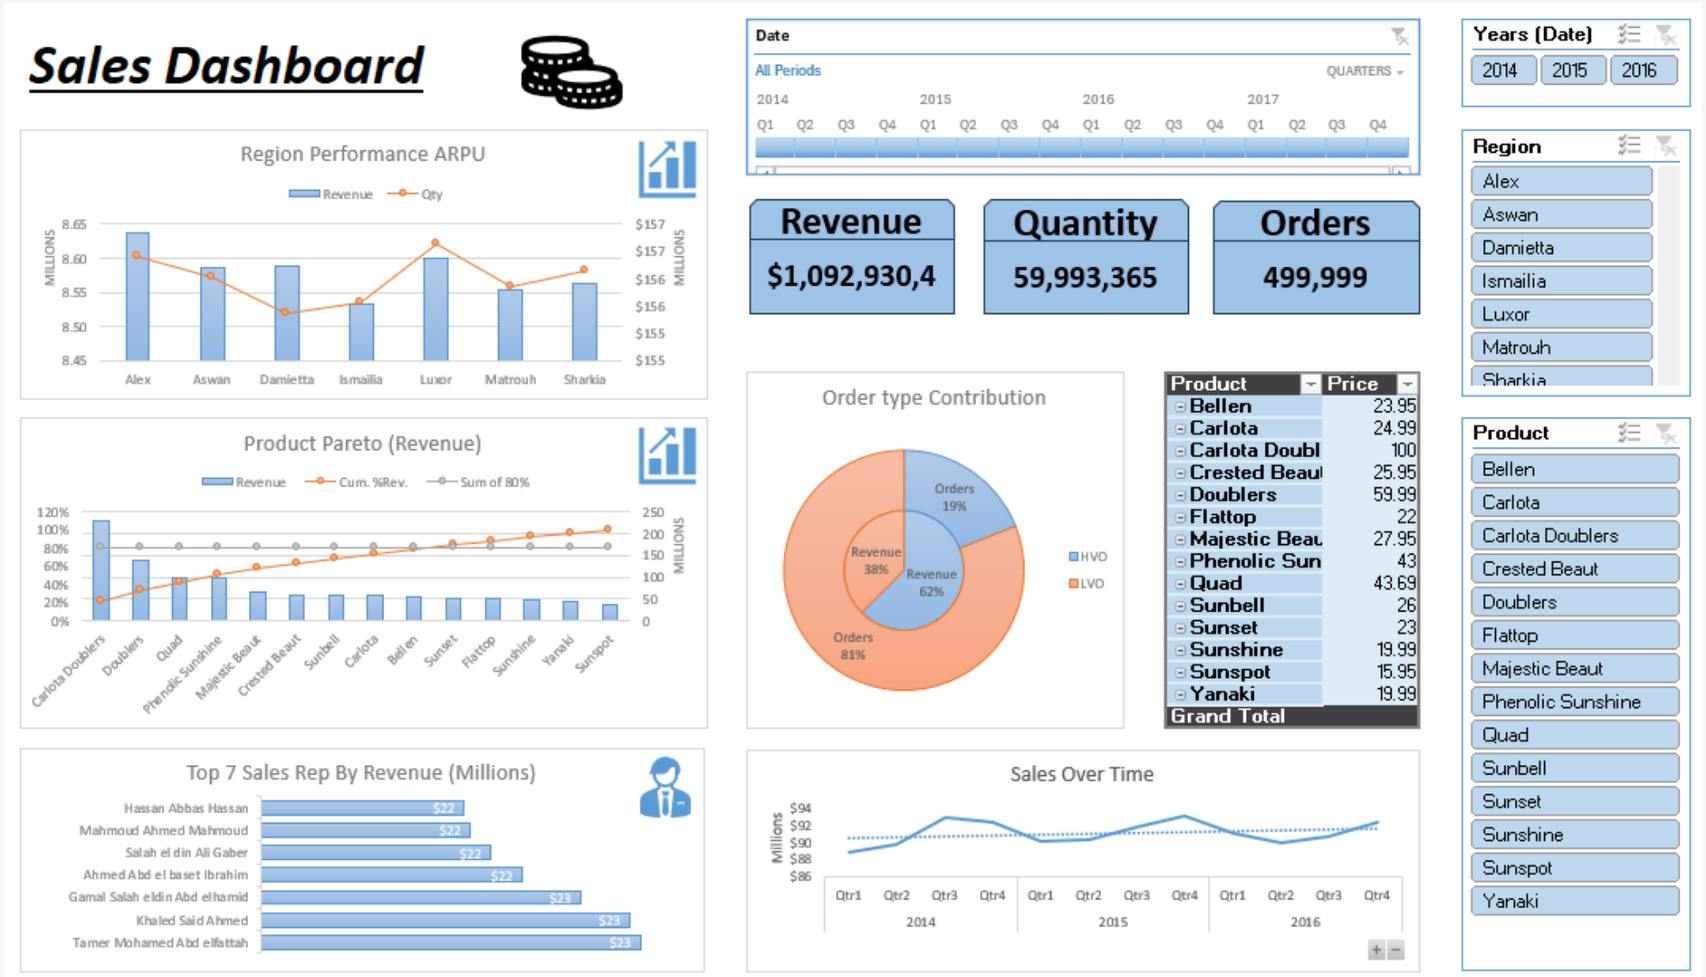

Exhibit 1. Supplied dashboard screenshot. The Revenue card is clipped; the complete value below is reconciled to workbook records.

1.093B

Net sales

Exact total: 1,092,930,458.87 in source currency.

59,993,365

Units

Sum of Units across all transaction records.

499,999

Transaction records

Count of populated rows; distinct orders unverified.

BUSINESS CASE

Product mix & order-value concentration

Identify the contributors behind revenue across a three-year transaction dataset.

The business question

Which products and order types account for most revenue? How does performance differ across regions and sales reps, and how does revenue change over time?

Scope and validation

499,999 transactions from 1 January 2014 to 31 December 2016, across seven regions and 14 products. Recomputed every row using Units x Price x (1 - Discount); no saved-value mismatch exceeded 0.001.

01 High-volume order contribution

HVO records are 19.0% of transactions but contribute 62.5% of net sales. The source defines HVO as more than 280 units.

Action: review the service and discount policies for this segment; revenue alone does not establish profitability.

02 Product Pareto

Carlota Doublers contributes 229.71M (21.0%). The top nine products account for 78.8%; the top ten reach 83.6%.

Action: prioritize availability for leading products. This dataset does not demonstrate a literal 80/20 product split.

03 Regional comparison

Alex has the highest revenue at 156.84M; Ismailia the lowest at 155.55M. The range is narrow. Compare units, discount levels and selling mix before treating the difference as material.

Time and representative views

Quarterly revenue, a Top 7 rep ranking and a product-price list provide supporting detail. Record totals are transaction counts: the supplied table contains no unique Order ID.

Evidence: streamed source records, Report worksheet and pivot/chart definitions. Dollar symbols appear in the dashboard; the currency code is not established.

TECHNICAL EVIDENCE

Excel calculations, pivots & interactive filters

An auditable calculation layer supports the visual analysis.

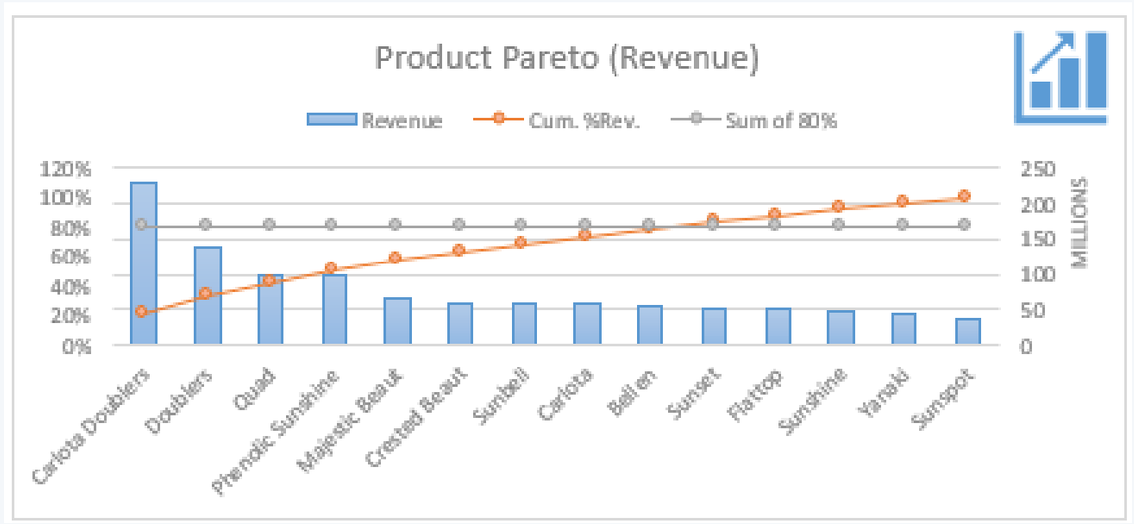

Exhibit 2. Pareto chart with an 80% reference line.

Exhibit 3. Year, region and product slicers. A native date timeline is also present in the workbook.

NetSales = Units x Price x (1 - Discount)

Order Type = IF(Units > 280, "HVO", "LVO")

Structured source table

The Sales table spans A1:I500000 on fTransaction. It stores date, rep, units, product, price, discount, region, net sales and order type.

Seven PivotTables

Shared cache feeds the summary, regions, product contribution, order types, Top 7 sales reps, quarterly sales and product price list.

Five charts and a Pareto threshold

Combo charts compare revenue and quantity and show ranked product revenue with cumulative contribution and an 80% reference.

Filter controls

Three slicer caches and a date timeline support filtering. Native interaction and refresh still need verification in Excel.

Presentation checks

Widen the Revenue card. Rename Region Performance ARPU: its chart uses revenue and quantity, not a per-user ratio. Label record counts and currency clearly, and test slicers against all intended charts.

Source: Dashboard(1)(1).xlsx and supplied screenshot. Source values and all NetSales calculations were checked; the workbook was not modified.

PROJECT 04

Revenue & Margin Analysis

A Power BI report comparing revenue, gross margin, suppliers, sales teams and monthly patterns.

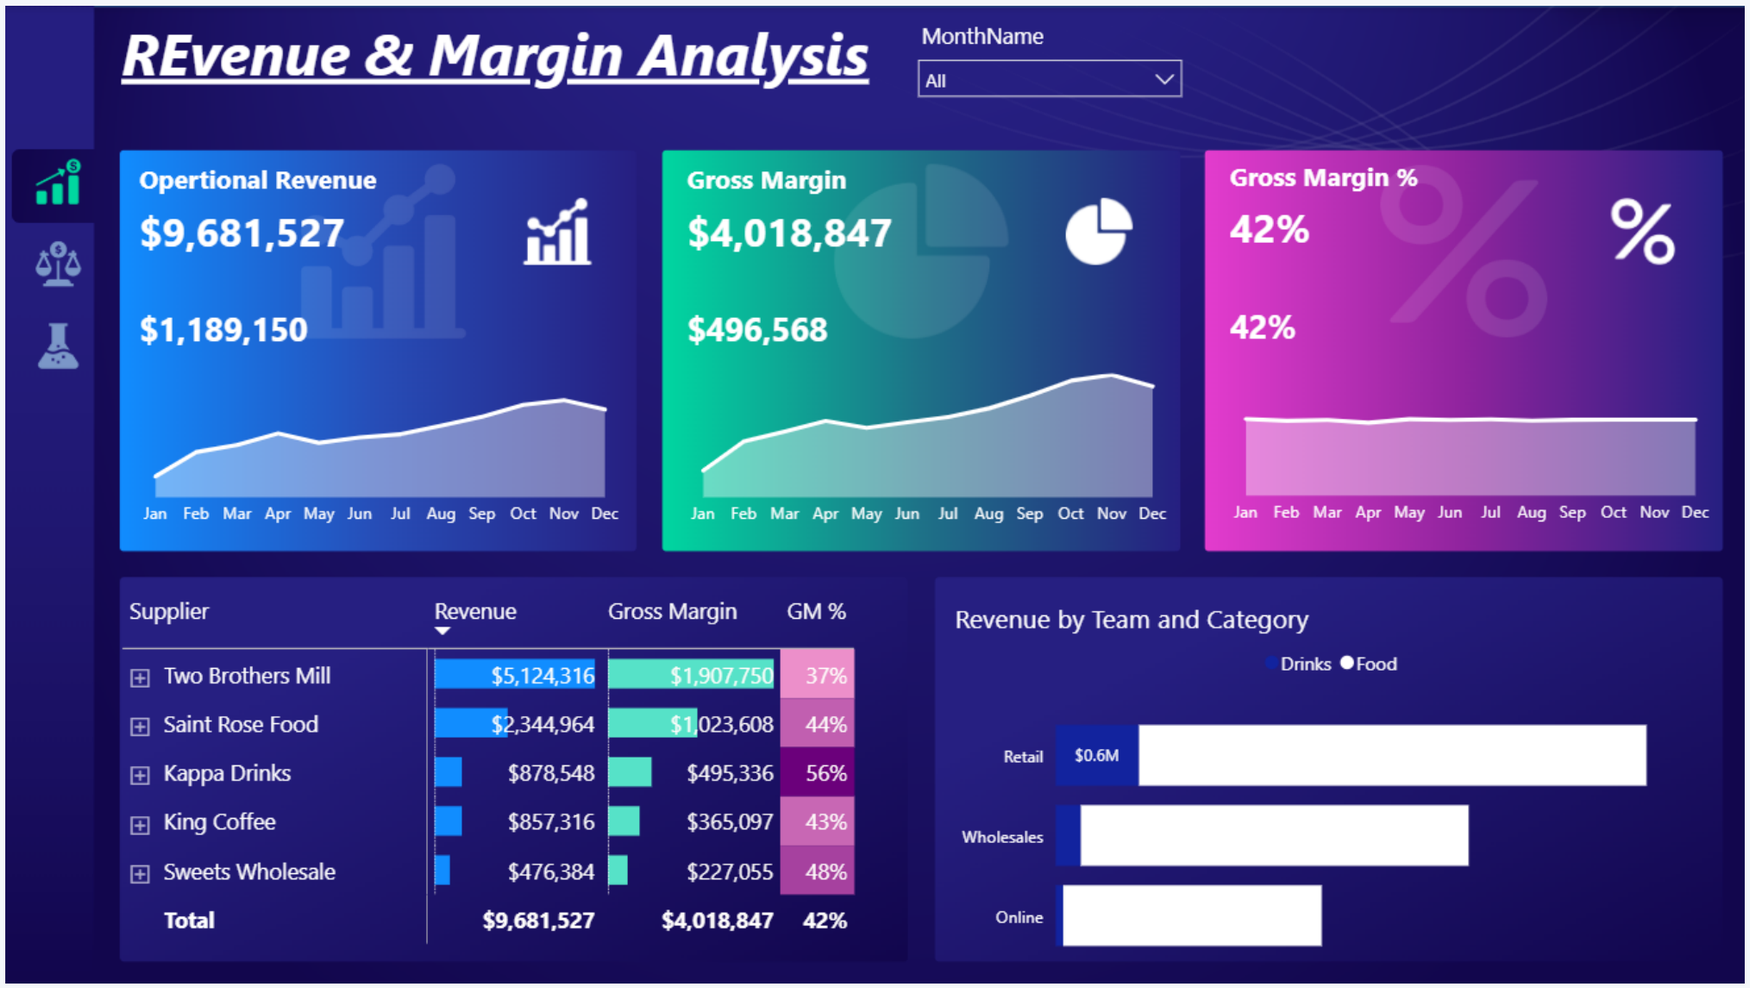

Exhibit 1. Supplied report snapshot with MonthName = All. Reporting year and currency code are not established by the screenshot.

9,681,527

Revenue

Displayed total; the report uses a dollar symbol.

4,018,847

Gross margin amount

Displayed total; cost definition needs verification.

41.51%

Gross margin rate

Computed ratio; the dashboard rounds it to 42%.

BUSINESS CASE

Revenue scale versus margin quality

Use supplier-level comparisons to distinguish contribution from profitability rate.

The business question

Which suppliers generate the most revenue and gross margin? Does the highest-revenue supplier also deliver the highest margin rate? How does the mix vary across teams and product categories?

Report scope

The main revenue page includes six cards, three monthly area charts, a supplier/product-group matrix, a team/category bar chart and a MonthName slicer. Two other pages contain images only and are not treated as completed analyses.

01 Supplier concentration

Two Brothers Mill contributes 5,124,316 in revenue, or 52.9% of the displayed total. Its gross margin amount is 1,907,750.

Action: review concentration alongside contract terms, service levels and the economics of this supplier.

02 Different margin profiles

Two Brothers Mill displays a 37% margin rate; Kappa Drinks displays 56% on revenue of 878,548.

Action: investigate pricing, discounts and cost composition before recommending a change in supplier or product mix.

03 Weighted total margin

4,018,847 / 9,681,527 = 41.51%, rounded to 42%. Total margin rate should be calculated from aggregated margin and revenue, rather than averaging supplier percentages.

Top-month KPI context

Secondary cards show revenue of 1,189,150 and gross margin of 496,568. Each uses its own Top 1 month filter. They are not verified prior-period comparisons or necessarily the same month.

Findings use the supplied snapshot and report definitions. DAX expressions, cost basis, period coverage and native-model results remain unverified.

TECHNICAL EVIDENCE

Measures, hierarchy & contextual comparisons

The report configuration supports the displayed analytical features.

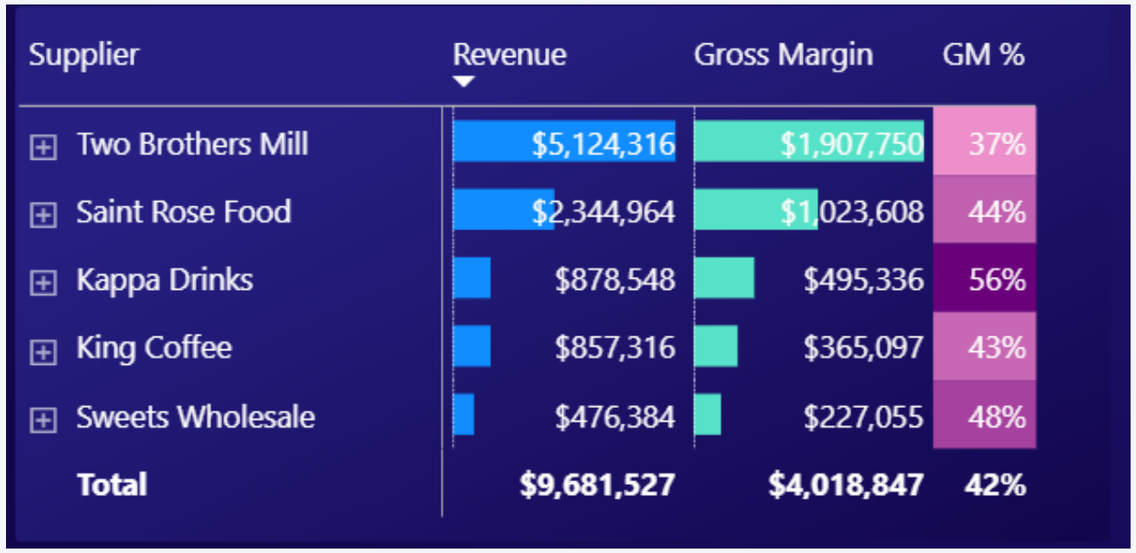

Exhibit 2. Supplier matrix with revenue and margin.

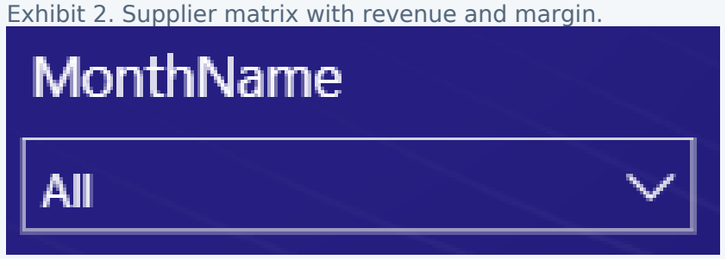

Exhibit 3. MonthName slicer.

The matrix can expand from supplier to product group. Cell data bars make large revenue and margin contributions easier to compare.

Reusable measure references

Visuals reference Revenue, Gross Margin and Gross Margin %. Cards, trends and matrices use the same named measures.

Top N filter context

Separate Top 1 month filters select the secondary revenue, margin and margin-rate cards. The context should be labelled explicitly for viewers.

Dimensional organization

The model diagram lists Revenue, dProduct, Supplier, dSalesPerson, dCalender and Key Measure. Relationship details require native verification.

Breakdowns and formatting

Supplier/product-group hierarchy, monthly area charts, a team/category bar chart, a month slicer and matrix data bars connect overview metrics to detail.

Final checks

Verify revenue and cost definitions, saved DAX, relationships and reporting dates. Label the Top 1 month cards. Correct Opertional Revenue spelling, clarify currency, and hide unfinished image-only pages.

Evidence: jjj(1).pbix report/layout and model-diagram definitions, plus supplied screenshot. Power Query transformations were not established.
